

# HOW TO UPDATE THE VIDEO SCREENS

Team reference - reusable SVG workflow

## Purpose

Beaumont update videos use a **small family of reusable screens**. They share the same visual language and should be treated as templates, not recreated from scratch for every episode.

**Core rule:** duplicate the previous approved SVG, change only the content that genuinely changes, rename it correctly, then inspect the rendered result before publishing.

## 1. Screen family

| Screen type           | Role                                                           | Typical editable content                                   |
|-----------------------|----------------------------------------------------------------|------------------------------------------------------------|
| Update / title screen | Introduces the episode or project update.                      | Update number, date, episode title.                        |
| Content / image frame | Presents one or more images in the established Beaumont frame. | Image assets, captions if used.                            |
| Main endscreen        | Closes the video and announces the next update.                | Next update title; music/licence text only when needed.    |
| Journal / QR screen   | Sends viewers to the written Flying Fortress Games journal.    | Next update title; QR destination only if the URL changes. |

## Visual identity

Use the established **Beaumont / Flying Fortress Games** language: dark emerald or midnight field, brass/copper accents, ivory for high-contrast functional areas, restrained geometric Art Deco framing, clean typography, and generous spacing. Do not introduce unrelated decorative motifs.

## 2. Naming convention

For end-of-video assets, the filename describes the **video the screen belongs to**, then the update it announces.

| Asset          | Pattern                                       | Example                                       |
|----------------|-----------------------------------------------|-----------------------------------------------|
| Main endscreen | beaumont_updateNN_endscreen_next_updateMM.svg | beaumont_update11_endscreen_next_update12.svg |
| Journal / QR   | beaumont_updateNN_journal_next_updateMM.svg   | beaumont_update11_journal_next_update12.svg   |

Example: Update 11 announces Update 12, so the asset belongs to **Update 11** even though the visible text says **UPDATE 12 - WRENCHFALL**.

## 3. Editing text

Open the SVG in VS Code or another plain-text editor. For the next-update line, search for:

```
<text id="next-update-topic"
```

Replace only the visible text inside that element:

```
<text id="next-update-topic" ...>  
  UPDATE 12 - WRENCHFALL  
</text>
```

Current convention is deliberately short: **UPDATE NN - SUBJECT**. If the previous update did not explain a title such as **LA BEAUMONT**, there is no need to explain **WRENCHFALL** on the endscreen either.

## 4. Update / title screen

Use this for the opening identity of an update. Keep the hierarchy simple: project/update label, number or date where appropriate, then the episode subject. Preserve the existing frame, proportions, spacing and visual hierarchy.

**Do not:** add gradients, metallic effects, extra ornaments, random borders or new fonts simply because the title changes.

## 5. Content / image frame screen

This screen is a carrier for artwork, photographs, references or comparisons. The frame is part of the identity; the content should change, not the decorative system.

| Check           | Requirement                                                          |
|-----------------|----------------------------------------------------------------------|
| Image fit       | Preserve intended crop and aspect ratio; do not stretch.             |
| Margins         | Keep artwork clear of the brass frame and corner ornaments.          |
| Multiple images | Use the established panel layout rather than improvising a new grid. |
| Captions        | Keep short, legible and subordinate to the image.                    |

## 6. Main endscreen

This contains the Beaumont frame, Art Deco skyscraper ornament, **SUBSCRIBE FOR MORE UPDATES**, the next-update announcement, and the music/licence credit.

### Useful SVG IDs

| ID                | Purpose                            |
|-------------------|------------------------------------|
| next-update-label | NEXT UPDATE label                  |
| next-update-topic | Update number and subject          |
| music-credit      | Music title / Kevin MacLeod credit |
| license-credit    | CC BY licence line                 |
| license-url       | Licence URL                        |
| skyscraper        | Top Art Deco ornament              |

## 7. Journal / QR screen

The journal screen uses the same visual language but gives most of the useful area to a large, scannable QR code.

### Current destination:

<https://www.flyingfortressgames.com/journal>

The QR artwork is vector content inside `id="journal-qr"`. Keep the brass/copper treatment, the light ivory quiet zone and strong contrast.

**Do not** crop the quiet zone, place text over the code, distort it, or recolour individual modules. If the destination changes, regenerate the QR rather than editing its squares manually.

## 8. Pre-publish checks

| Check           | What to verify                                                                              |
|-----------------|---------------------------------------------------------------------------------------------|
| Text clearance  | No title or label intersects the skyscraper, frame or separators.                           |
| Typography      | No overflow, clipping or accidental font substitution.                                      |
| Image layout    | No stretching, unwanted crop or inconsistent panel spacing.                                 |
| QR scan         | Scan the rendered frame from another device; it must open the journal URL.                  |
| Contrast        | QR remains clearly legible against the ivory field.                                         |
| No layout drift | Borders, separators, ornaments and credits remain in approved positions.                    |
| Filename        | Current update number identifies the video; next update number identifies the announcement. |
| Final preview   | Open/render the SVG at 1920x1080 and inspect it at full frame.                              |

## 9. Minimal workflow for every update

1. Identify which existing screen type is needed.
2. Duplicate the latest approved version of that screen.
3. Rename the file using the established convention.
4. Change only the necessary text, images or destination.
5. Open the SVG in a browser and inspect the full frame.
6. For QR screens, scan the rendered code.
7. Export or render the final production asset.

**Rule of thumb:** preserve the template. A new update normally changes content, not design.

## Reference palette

| Role                   | Reference                                                |
|------------------------|----------------------------------------------------------|
| Dark field             | Emerald / midnight green                                 |
| Primary accent         | Brass / copper                                           |
| Functional light field | Ivory                                                    |
| Secondary neutral      | Slate / walnut                                           |
| Style                  | French industrial Art Deco; clean, geometric, restrained |
