

HOW TO UPDATE THE BEAUMONT END SCREENS

Team reference - editable SVG workflow for future project updates

Purpose

Each Beaumont video currently uses two editable SVG screens: **(1) the main endscreen**, with the next-update announcement and music credit, and **(2) the journal / QR screen**, with a large scannable code linking to the Flying Fortress Games journal.

Do not rebuild the artwork for every episode. Duplicate the previous SVG, change the update number and subject, save under the new filename, then visually check the result.

1. File naming

The filename describes the video the screen belongs to, not the update being advertised.

Screen	Pattern	Example
Main endscreen	beaumont_updateNN_endscreen_next_updateMM.svg	beaumont_update11_endscreen_next_update12.svg
Journal / QR	beaumont_updateNN_journal_next_updateMM.svg	beaumont_update11_journal_next_update12.svg

Example

Update 11 advertises Update 12, therefore the file is named beaumont_update11_..._next_update12.svg.

2. Editing the next-update text

Open the SVG in VS Code or another plain-text editor. Search for:

```
<text id="next-update-topic"
```

Only replace the visible text between the opening and closing <text> tags.

```
<text id="next-update-topic" ...>  
  UPDATE 12 - WRENCHFALL  
</text>
```

Keep the wording short. Current convention is simply **UPDATE NN - SUBJECT**. Do not add an explanatory subtitle unless the episode specifically requires one.

3. Main endscreen

The main endscreen contains the Beaumont frame, the Art Deco skyscraper ornament, **SUBSCRIBE FOR MORE UPDATES**, the next-update line, and the Kevin MacLeod / Incompetech credit.

Useful element IDs

ID	Purpose
next-update-label	NEXT UPDATE label
next-update-topic	Update number and subject
music-credit	Music title / Kevin MacLeod credit
license-credit	CC BY licence line
license-url	Licence URL
skyscraper	Top Art Deco ornament

4. Journal / QR screen

The QR screen uses the same Beaumont visual language but gives most of the useful space to the QR code. It links to:

<https://www.flyingfortressgames.com/journal>

The QR itself is vector artwork inside `id="journal-qr"`. Do **not** manually redraw, recolour individual modules, crop the quiet zone, or place text over the code.

Current QR treatment: brass/copper modules on a light ivory field, approximately 80% of the first oversized version. The code must remain large enough to scan from a YouTube video.

5. Visual checks before publishing

Check	What to verify
Text clearance	The next-update text does not intersect the skyscraper or border.
QR scan	Scan the rendered screen from another device; it must open the journal URL.
Contrast	QR modules remain clearly darker than the ivory field.
No layout drift	Borders, separators and credits remain in their established positions.
Filename	Current update number = the video; next update number = the announcement.
Preview	Open the SVG in a browser or export a PNG and inspect at full frame.

6. Minimal workflow for every new update

1. Duplicate the previous endscreen SVG and journal/QR SVG.
2. Rename both files using the current-video / next-update convention.
3. Change only next-update-topic unless another field genuinely needs updating.
4. Open both SVGs in a browser and inspect them.
5. Scan the QR code.
6. Export/render the final video assets.

Rule of thumb: preserve the template. Future updates should normally be a text substitution, not a redesign.
